In 2015, a total of 89,884 flights were cancelled, reflecting a significant operational impact during the year. The highest number of cancellations occurred in February 2015, while the lowest was recorded in September 2015. Weather was the primary cause, accounting for 54% of total cancellations, making it the most significant contributing factor. Additionally, 27% of cancellations were due to Airline/Carrier-related issues, further influencing the overall disruption in flight operations.

Overall Delayed Hours

Detailed Delayed Hours

Departure Delay is the major contributor to overall flight delays, accounting for 38% (895,307 hours) of the total delay time. Arrival Delay and Late Aircraft Delay are the next significant factors, each contributing around 18% of total delays. For flights departing from Boston, departure delays are also the highest with 16,854 hours (0.71%), while Security Delay has the least impact on overall delays.

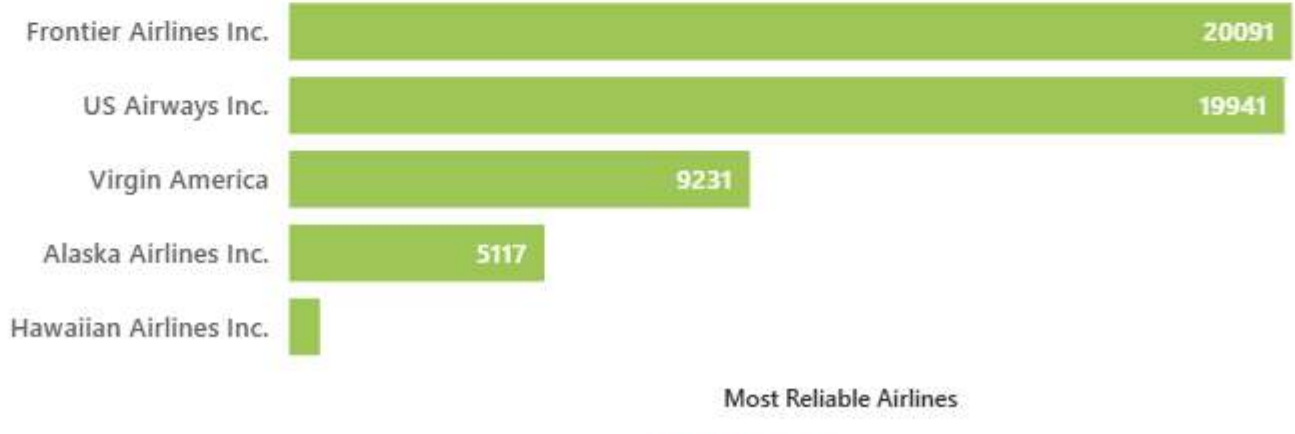
Bottom 5



In 2015, Southwest Airlines recorded the highest total departure delay, reaching approximately 219,775 hours, making it the least reliable airline in terms of on-time departures. This indicates a significant amount of accumulated delay across its flights during the year. On the other hand, Hawaiian Airlines showed the best performance, with only 616 hours of total departure delay. This highlights Hawaiian Airlines as the most reliable airline with comparatively minimal delays.

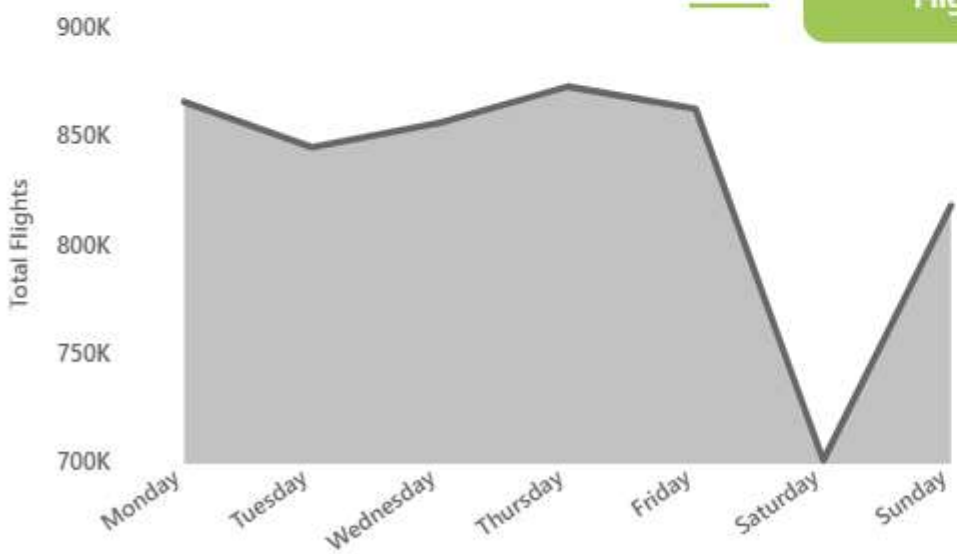
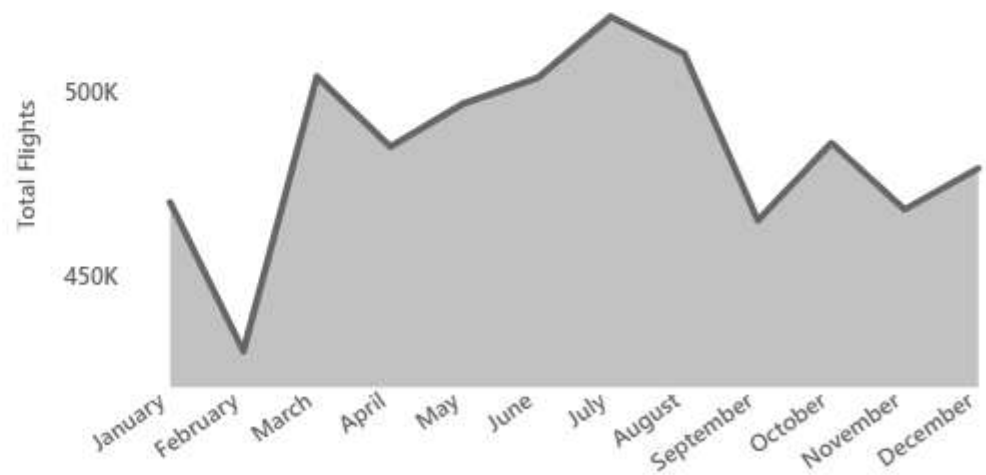
Delayed Airlines

Delayed Flights

The analysis shows that 37% of flights experienced departure delays, with an average delay time of about 33 minutes. Some airlines have a lower percentage of delayed flights but still experience relatively high average delay minutes, indicating that when delays occur, they can be significant. On the other hand, a few airlines show higher delay percentages but shorter average delay durations. Overall, the comparison highlights clear differences in airline reliability in terms of both frequency and severity of delays.

Flights Volume





The flight volume analysis shows clear patterns across both Weekday distribution and Month-wise distribution. Weekday traffic remains relatively high, with Thursday and Friday recording the highest number of flights, while Saturday shows a significant drop in flight volume before recovering again on Sunday. On a monthly level, flight activity gradually increases through the year, peaking around July and August, which likely reflects higher travel demand during the summer period. In contrast, February records the lowest flight volume, indicating seasonal fluctuations in air travel demand.
